

Evidence-Based Nursing

Contents

Editorial

- 97 Patient and public involvement in the implementation of evidence into practice

Research made simple

- 98 Understanding triangulation in research

Midwifery

- 99 Cohort study finds newborn respiratory complications less common when mothers of babies with fetal lung immaturity at 34–37 weeks' gestation given antenatal steroids

Adult nursing

- 101 Exercise improves fatigue during and after breast and prostate cancer treatment, with benefits seen for aerobic exercise

Child health

- 103  Contact with dogs during the first year of life is associated with decreased risk of respiratory illness
- 104 For vulnerable families, continued postnatal care, provided by family midwives, is associated with improved maternal care and parent–child relationship
- 105 Vitamin D concentration in newborn cord blood is correlated with maternal intake of supplemental vitamin D, and lower levels are associated with increased risk of the infant developing eczema

Health promotion

- 107 Sunbed use increases risk of melanoma; risk increases with greater number of sessions and first use at younger age
- 108 Mobile phone-based smoking cessation interventions increase long-term quit rates compared with control programmes, but effects of the interventions are heterogeneous

Primary health care

- 110  People with diabetes and self-reported severe hypoglycaemia have increased mortality risk over 5 years
- 111 General health checks may not reduce morbidity or mortality but do increase the number of new diagnoses

October 2013 Vol 16 No 4

- 112 Compared to standard physician care for diabetes, nurse specialists provide similar care in terms of quality of life

- 113  Updated systematic review suggests that cranberry juice is not effective at preventing urinary tract infection

Pain management

- 115 Movement pain, resting pain and depression prior to total knee replacement predict postoperative pain

Nursing issues

- 117 Scientific nursing journals over 25 years: most studies continue to focus on adults and psychological variables, with a decline in theory-testing-based studies and an increase in qualitative studies
- 118 US Medicare data show incidence of hospital-acquired pressure ulcers is 4.5%, and they are associated with longer hospital stay and higher risk of death
- 119 Hospital nursing units in the USA: government ownership, Magnet designation, unit population age group and higher skill mix are associated with lower nursing turnover
- 120 Cochrane reviews allow firm conclusions to be made about the effectiveness of various local and systemic treatments for wounds and ulcers

Care of older people

- 122 Increased city-level influenza mortality and state-level influenza severity is associated with greater functional decline among nursing home residents
- 123 Pain assessment and management in older hospitalised patients: observation shows common themes relating to nurse–patient communication, pain management strategies, organisational aspects of care and the complex nature of pain
- 124 Exposure to challenging behaviour from nursing home residents is associated with reduced general health and work ability, and increased burnout reported by nurses

PostScript

- 126 Letter of response to the commentary written by Dr Howell
